

MEANS FOR THE ADJUSTMENT OF RINGS OR OTHER SIMILAR
GOLD AND SILVER ARTICLES OF JEWELRY AND COSTUME
JEWELRY

ABSTRACT

The present solution permits to carry out rings according to an only
size typology since such rings are then adapted to the personal
requirements of the customers, there being no need of cutting and
soldering an annular portion. Basically, the said means is represented
by a coupling head (2) which may be provided with seats for the
setting of stones (3) according to the most suitable uses and
conformations for the customers and market. The coupling head (2) is
provided with at least an inner seat (4) for the insertion of the real ring
body (5). The ring is open at least to a certain extent and therefore, it
shows two free ends (6, 7). One of the two free ends (6, 7) and more
precisely the ring end (7) is fixed to the initial part of the said seat (4)
while the other ring end (6) remains free and is displaceable along
the seat itself to permit an adjustment of the ring according to the
wished size.
